

14. (Amended) A method of manufacturing a liquid crystal display device, said method comprising the steps of:

preparing an element substrate and an opposing substrate, one of said element and opposing substrates having a hole portion;

forming a sealing material over one of the element and opposing substrates;

joining the element and opposing substrates;

injecting a liquid crystal material into a gap between the element substrate and the opposing substrate through the hole portion;

scribing the joined element and opposing substrates to form a plurality of liquid crystal display devices, each of said plurality of liquid crystal display device having an open portion, peripheral seal portion and an external lead-out wiring portion.

32. (Amended) A method according to claim 14, further forming a resin in said hole portion after joining the first and second substrates.
